

## Acceptance Tests

Test #	Test Case	Expected Result
1	Test new account registration page	Accounts should be created with a valid email address and password, account information is stored in the system.
2	Test Cart Page	Once an item is clicked on and added to cart, the cart page should dynamically update the cart page so that it contains the item that was just added. Test with multiple items and see if those items show up in the cart page
3	Test Transaction process	Once the cart has an item or items, proceed to the checkout page. The system should ask for shipping details and necessary information such as shipping options, payment method, etc.
4	Cart Quantity check	In the cart page itself there is an option to increase or decrease the quantity of an item, if + is clicked the quantity for that item should increase by one and the subtotal amount should also increase simultaneously as well
5	Product Details	The product that is being tested should have all the correct details for example each item in the system should have a description, a picture of the product, instock, etc.
6	Website Navigation	Click through all links in the website to make sure that none of the links are broken. Check that all the links redirect the user to the correct corresponding page.
7	Payment Check	Test payment provider service by purchasing a demo product and seeing if payment has successfully went through, this makes sure that the systems payment network is functioning correctly
8	Order History	Check if the system has successfully recorded previous orders in the order history page according to the corresponding account that is logged in
